

UVCMI 777™ · METHODOLOGY PRIMER

One Indicator. Every Timeframe. As a Function of Time.

The foundational methodology behind every Dr. UVC tracker — a single momentum operator, computed across seven timeframes, read as a living film of the market.

DR UVC Market Insights™ · Dr. UV

The Idea in One Sentence

Take one momentum indicator, compute it on every timeframe — 1-hour, 2-hour, 4-hour, daily, 2-day, 3-day, weekly — and watch it move through time, all at once.

That single view tells you three things an ordinary chart can't:

- **Which way each timeframe is leaning** — green (up) or pink (down).
- **How the trend is shifting** — is strength draining from the short timeframes into the long, or building the other way?
- **How big to be** — when every timeframe agrees, conviction is high; when they're split, it's time for caution.

The Operator: UVCBI (UB)

The engine rests on a single operator — **UVCBI (UB)** — a close-only momentum oscillator built on a Fibonacci-spaced lookback. It is computed independently on each of seven timeframes (1H, 2H, 4H, D, 2D, 3D, W) and aligned to a common anchor **as a function of time**: at every bar, each timeframe contributes its most recent completed value, with no look-ahead. The result is a multi-timeframe matrix that **evolves bar by bar** — the foundational difference from conventional tools, which render only the current snapshot.

Reading the Grid

Each row is one bar in time. The columns are the same indicator on seven timeframes. **Green = positive; pink = negative.** A sequence counter on the left tracks the current move and **resets to 1 the moment the trend turns.**

The signal is in the **spread**. When a turn begins, the short timeframes (1H, 2H) flip first — the instant it happens, not days later. Over the next bars you watch the change **climb the stack**: 1H → 2H → 4H → into the Daily, while the longer frames still hold. That spreading color is something a single static chart can never show you: a trend weakening in real time, one timeframe at a time.

Why “Function of Time” Changes Everything

A normal multi-timeframe view is a **snapshot** — where the timeframes stand right now. Useful, but the story is gone: you can't tell whether the alignment is forming or falling apart. Computing the indicator as a **continuous series through time** restores the motion — the turn-points, the order timeframes flip in, how many bars each leg lasts. The market stops being a photograph and becomes a **film you can replay** — and, with enough history, anticipate. You see the turn forming while it's still in the short timeframes, before it reaches the ones everyone else watches.

Validation

The methodology is held to a strict standard: **exact reproduction** of the proprietary engine, and high agreement with an independent commercial reference.

Test	Result
UB vs proprietary template (BTC, 2010–2026)	R ² = 1.0 — exact
UB vs proprietary template (NDX, 1985–2026)	0.0 difference, 10,206 rows — exact
1H UB vs independent commercial indicator	86.6% state agreement
1D UB vs independent commercial indicator	95.3% state agreement
Agreement by timeframe	rises 87% (1H) → 97% (2D/3D)

Two findings of note. First, the engine reproduces the proprietary calculation **identically across two asset classes** (equities and crypto) — establishing calculation integrity. Second, against the independent reference, UB produces the **same directional state ~90% of the time while generating roughly half the signal turns** (57 vs 127 at the band threshold): equal signal, materially less whipsaw.

What's Coming

This is the foundation of the Dr. UVC system — one validated indicator, read across every timeframe, as a function of time. Layered on top:

- the **full indicator family** (momentum, conviction, and more),
- the **position-sizing logic** — how the spreading green/pink tells you how big to be,
- and the **deep-history analytics** that turn this into a measured, backtested edge.
